**Summary**

Here is the abstract of our paper. Here is a test.

# Contents

# 1 Introduction

## 2 Assumptions and Notations

### 2.1 Assumptions

The following reasonable assumptions are made to reasonably simplify the model:

- Government policies (such as taxes, subsidies, regulations, etc.) remain unchanged during the period of the model.
- No major event compromising or promoting the tourism industry will occur during the period of our model.
- Consumer behavior, consumer preferences, or market demand are assumed to remain unchanged.

### 2.2 Notations

The primary notations used in this paper are listed in Table 1.

Table 1: Notations

Symbol	Definition
$A$	the first one
$b$	the second one
$\alpha$	the last one

## 3 Preliminary Analyses

We first analyse the potential factors that may affect the tourism industry in Juneau, thus enabling a smoother transition to the model building process.

### 3.1 Number of Tourists

We found no existing data on the number of tourists visiting Juneau each year, but we can infer it by other means.

According to [source] and [source], among all the transportation methods, cruise ships are the most popular way to visit Juneau, accounting for over 90% of the total number of tourists. As the number of cruise ship passengers is available online, we can use it as a proxy to estimate the total number of tourists.

According to [source], the number of cruise ship passengers visiting Juneau is as follows:

Table 2: Number of Cruise Ship Visitors to Juneau

<i>Year</i>	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023
<i>Num(in thousands)</i>	961	983	1015	1072	1151	1306	0	117	1167	1670

It can be easily noted that numbers plummeted in 2020 and 2021 due to the COVID-19 pandemic. In this section, we use the *SARIMAX* model including the pandemic factor to predict the number of tourists in the next few years.

### 3.1.1 SARIMAX Model

The *SARIMAX* model, which stands for *Seasonal AutoRegressive Integrated Moving Average with exogenous regressors*, is an extension of the *ARIMA* (*AutoRegressive Integrated Moving Average*) model that incorporates seasonal effects and external variables. Since we need to consider the impact factors during the pandemic, *SARIMAX* is used instead of *ARIMA*.

### 3.1.2 Parameters Setting

- **Pandemic Impact Factor:** Given the severity of the COVID-19 pandemic, different factors are set. In 2020, 2021 when the pandemic was at its peak, factors are set to 1, in 2021 set to 0.3, and in other years set to 0.
- **Order (p, d, q):** The order of the *ARIMA* part of the model is set to (2, 1, 1) after conducting the ACF and PACF analysis(see Figure 1).
- **Enforce Stationarity:** The `enforce_stationarity` parameter is set to True to ensure the model is stationary.
- **Enforce Invertibility:** The `enforce_invertibility` parameter is set to True to ensure the model is invertible.

### 3.1.3 Model Results

The *SARIMAX* model is trained on the data from 2014 to 2023 and used to predict the number of tourists in the next few years. The prediction result is listed as follows. The residuals, ACF and PACF plots are also shown in Figure 1.

Figure 1: Tourist Prediction

It can be seen that the model correctly handles the plummet during the pandemic and captures the trend of the revival of tourism. The exact number of tourists in the next few years is shown below, which will be utilized in the following sections.

Table 3: Number of Tourists Prediction

Year	2024	2025	2026	2027	2028
Num(in thousands)	1701	1774	1842	1909	1976

## 3.2 Number of Local Residents

### 3.2.1 Population of Juneau

According to *World Population Review*, the population of Juneau in the last decade is as follows:

Table 4: Population of Juneau

Year	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
Num (in thousands)	31.4	32.2	32.4	32.6	32.5	32.6	32.5	32.1	32.0	32.0	32.2	32.0	31.7	31.6	31.3

### 3.2.2 Population Prediction

We still use the *SARIMAX* model proposed in the last section to predict the population of Juneau in the next few years. Parameters are the same as the last section. The first four pictures are still the original data and predicted data, the residual, ACF and PACF plots. In addition, official prediction data can also be found in *World Population Review*, therefore two additional pictures are added to compare the prediction results.

Figure 2: Tourist Prediction

It can be concluded from subfigure 4 and 5 that the model fits the data well and the prediction is reliable. The exact number of local residents in the next few years is shown below.

Table 5: Population Prediction

Year	2025	2026	2027	2028	2029
<i>Num(in thousands)</i>	31.2	30.8	30.7	30.4	30.0

## 4 Task 1: Model for Tourism Industry in Juneau

### 4.1 Introduction

In this section we need to select factors to quantify and track the tourism industry in Juneau. It is impossible and unnecessary to consider all the factors that may affect the tourism industry, only those that are relevant to the problem need to be considered. Drawing on the idea of the divide-and-conquer algorithm, we first divide the factors into three categories: economy, society and environment.

$$\mathbb{T} \text{ Output} = \alpha \cdot \text{Economy} - \beta \cdot \text{Society} - \gamma \cdot \text{Environment} \quad (1)$$

Our goal is to maximize the economy income, minimize the social cost and environmental impact, where parameters  $\alpha$ ,  $\beta$  and  $\gamma$  denote how much importance we attach to each category. Intuitively, the goal aforementioned is equivalent to maximizing the output.

Each category is further divided into several minor factors such as local population, number of tourists to extrapolate a mathematical model fitting the circumstances in Juneau, which will be discussed in the following sections.

### 4.2 Economy

In this section we consider the actions that will contribute to the income of the tourism industry in Juneau, which are tourists' consumption, tax income and fines.

#### 4.2.1 Tourists' Consumption

### 4.3 Society

Societal factors such as infrastructure, price of housing products, and the mental loss due to the overcrowding and rowdy tourists all account for the social cost of the tourism industry.

### 4.4 Environment

According to the official website of Juneau, its tourism industry is mainly comprised of glacier tours, whale watching, rainforest tours and others. We assume each of these activities accounts for a certain percentage of the total environmental impact, denoted as  $v_1$ ,  $v_2$ ,  $v_3$  and  $v_4$  respectively. Due to the receding of glaciers, our goal is to lower the percentage of glacier tours and increase the percentage of other activities.

The main factors that affect the environment are carbon emissions and human disturbance, which will be discussed as follows.

## **5 Task 2: Model Adaptation and Migration**

In the previous section, we have established a model to quantify the tourism industry in Juneau. Based on this model we...

## 6 Task 3: Memo

### Recommendations for Sustainable Tourism in Juneau, Alaska

Dear Tourist Council,

It is our great honour to present to you our recommendations for sustainable tourism in Juneau, Alaska. We have conducted a thorough analysis of the current situation in Juneau and have identified several key areas that need to be addressed in order to ensure the long-term sustainability of the tourism industry in the region. Our recommendations are based on the principles of sustainable tourism, which aim to balance the economic, social, and environmental impacts of tourism in order to ensure that it can continue to benefit both the local community and the environment for generations to come. Our approaches, findings and suggestions are as follows.

Firstly we summarized a general equation aiming to balance the economic, social, and environmental impacts of tourism. Then we looked into these aspects and devised a model accordingly for each. *SARIMAX*, *Linear-Regression* models were used to ensure the accuracy and reliability of our findings and suggestions.

Here are some findings based on our predictions.

- **Economic Impact:**
- **Social Impact:**
- **Environmental Impact:**

Based on these findings, we put forward the following recommendations and measures.

- **Economy**
- **Society**
- **Environment**

I hope you find our recommendations useful and that they will help to guide the development of sustainable tourism in Juneau. We believe that by working together, we can create a more sustainable future for the tourism industry in the region. Thank you for your attention and consideration. Feel free to contact us for any further information.

Sincerely,  
Team # 2503720 Members

## Appendix A Further on L<sup>A</sup>T<sub>E</sub>X

## Appendix B Program Codes

```
1  #include <iostream>
2  using namespace std;
3  int main() {
4      cout << "Hello, World!" << endl;
5      return 0;
6  }
```
